CISSP StudyDeck — v1.1.2 Release Notes

> **Release Date:** April 18, 2026
> **Previous Version:** v1.1.1a

🚀 What's New in v1.1.2

New Study Content

- **cissp-scenarios-part-3.json** — 60 brand-new advanced scenario cards spanning all 8 CISSP domains
  - 10 beginner, 28 intermediate, 22 advanced difficulty cards
  - Covers 50+ topics not present in Parts 1 or 2, including:
    - SOAR platforms & SOC automation
    - ICS/SCADA & OT security
    - IoT device security
    - Mobile Device Management (MDM/BYOD)
    - Memory forensics & network forensics
    - HIPAA breach notification rules
    - Database inference & aggregation attacks
    - Blockchain for integrity verification
    - SAML vs. OAuth 2.0 vs. OpenID Connect
    - RADIUS vs. TACACS+
    - Brewer-Nash (Chinese Wall) model
    - DNS exfiltration & tunneling detection
    - 802.1X port-based NAC
    - Certificate pinning for mobile apps
    - TLS 1.3 improvements & forward secrecy (ECDHE)
    - Zero Trust Network Access (ZTNA/SDP)
    - Cloud IAM role chaining & privilege escalation
    - CASB for shadow IT visibility
    - Insider threat programs (UEBA, DAM)
    - API gateway architecture
    - Fuzz testing for vulnerability discovery
    - Software Composition Analysis (SCA/SBOM)
    - Insecure deserialization (OWASP)
    - Cross-domain solutions & data diodes
    - Endpoint Detection and Response (EDR)
    - Secure Multi-Party Computation (SMPC)
    - COOP vs. BCP vs. DRP
    - Kerckhoffs' Principle
    - Data sovereignty & cross-border transfer
    - CCPA/CPRA privacy rights
    - Mutual TLS (mTLS)
    - Measured boot & remote attestation
    - Tokenization vs. encryption
    - AES-GCM/AEAD encryption modes
    - And more

🐛 Critical Bug Fixes

Multi-Deck Import — Card Count Now Accurate

Problem: When importing multiple card deck files (e.g., Part 1, Part 2, Part 3), the total card count did not reflect the correct number. Instead of 180 cards (60 × 3 decks), only 60 cards were stored.

Root Cause: All three scenario deck files used the same internal ID scheme (`SC-001` through `SC-060`). IndexedDB uses the `id` field as the primary key, and `store.put()` performs an upsert — silently overwriting any existing record with the same key. When Part 2 was imported, its `SC-001` overwrote Part 1's `SC-001`, despite being a completely different card. Part 3 then overwrote Part 2.

Fix: Four files were updated to implement composite ID generation and two-tier duplicate detection:

File	Change
`parsers.js`	New `generateImportId()` function produces unique composite keys by combining the source filename with the original card ID (e.g., `cissp-scenarios-part-1__SC-001`). Applied to all three parsers: JSON, CSV, and plain-text. Original IDs are preserved in a `sourceId` field for display.
`importer.js`	Duplicate detection now uses two checks: (1) exact composite ID match detects same-file re-imports, (2) normalized `term + domain` content key detects true content duplicates across different files. Cards from different files with different content always receive unique IDs and are stored independently.
`db.js`	`prepareCardForStorage()` now guarantees a UUID fallback for missing IDs and preserves `sourceId`, `sourceDeck`, and all required array fields (`alsoSee`, `tags`, `relatedCards`). `migrateCards()` updated to fix legacy records missing these fields.
`app.js`	Import preview now categorizes duplicates by type (re-import vs. content match). Added null-safety checks. Home view stats refresh automatically after import completes.

Result:

Scenario	Before (v1.1.1a)	After (v1.1.2)
Import Part 1 (60 cards)	60 stored	60 stored
Import Part 2 (60 cards)	60 stored (Part 1 overwritten)	120 stored
Import Part 3 (60 cards)	60 stored (Parts 1 & 2 overwritten)	**180 stored**
Re-import Part 1	Silent overwrite, no change	60 detected as re-import, skipped

---

Extension Popup Crash Fix (popup.js)

Problem: `popup.js` threw an uncaught error at line 225 when the popup failed to load data, causing a blank popup with no recovery option.

Root Cause: The `catch` block attempted to access `document.getElementById('openNewTabFallback')` immediately after setting `innerHTML` on `popupBody`, without null-checking either element. If `popupBody` was null (DOM not ready or element missing), the entire catch block threw a secondary error.

Fix:

Change	Detail
Null-safe `popupThemeToggle`	Added existence check before attaching click listener
Null-safe `isDueToday`	Added guard for missing `sm2.nextReviewDate` property
Centralized `openStudyDeck()` helper	Wraps `chrome.tabs.create` with API availability check; graceful fallback to `window.open`
Null-safe `#popupBody`	Returns early with console error if element is missing
Safe streak access	Handles `undefined` streak data with `|| 0` fallback
Catch block rewrite	Stores element references before use, null-checks both `popupBody` and `openNewTabFallback` before attaching listeners

---

⚠️ Important: Post-Update Action Required

> **Users with existing imported data must clear their card store and re-import all decks after updating to v1.1.2.**

Previously imported cards have colliding IDs from the old scheme (e.g., multiple cards all stored as `SC-001`). The new composite ID system cannot retroactively fix records that were already overwritten. To get the correct total card count:

1. Open StudyDeck → **Settings** or **Deck Manager**
2. Clear all card data
3. Re-import all deck files (Part 1, Part 2, Part 3, starter deck, etc.)
4. Verify the total count reflects the sum of all imported cards

Study progress (SM2 data, review history) will be reset. If you need to preserve progress, export your data before clearing, then re-import — the export format includes SM2 state which will be restored on re-import.

🗂 Files Changed

Modified:
js/parsers.js — Composite ID generation for all format parsers
js/importer.js — Two-tier duplicate detection (ID + content)
js/db.js — Safe card storage with UUID fallback & metadata preservation
js/app.js — Import preview categorization & post-import refresh
js/popup.js — Null-safety & crash prevention in popup controller
manifest.json — Version bump to 1.1.2

Added:
data/cissp-scenarios-part-3.json — 60 new advanced scenario cards

```
---

## 📊 Project Stats

| Metric | v1.1.1a | v1.1.2 |
|---|---|---|
| Total study cards available | 120 scenarios + starter/beginner decks | **180
scenarios** + starter/beginner decks |
| Files | 21 | 22 |
| Domains with advanced coverage | 6 of 8 | **8 of 8** |
| Advanced difficulty cards | 18 | **40** |
| Known import bugs | 2 | **0** |

---

## 🔧 Technical Details

### Composite ID Format
```

{sanitized-filename}__{original-card-id}

Examples:
cissp-scenarios-part-1__SC-001
cissp-scenarios-part-2__SC-001 ← distinct key, no collision
cissp-scenarios-part-3__SC-001 ← distinct key, no collision
cissp-starter-deck__DEF-042

```
### Duplicate Detection Matrix

| Incoming Card | Existing Match By | Same Answer? | Action |
|---|---|---|---|
| Same composite ID | ID | Yes | Skip (re-import) |
| Same composite ID | ID | No | Merge (add as alsoSee) |
| Different ID, same term+domain | Content | Yes | Skip (content duplicate) |
```

```
| Different ID, same term+domain | Content | No | Merge (add as alsoSee) |
| Different ID, different term | None | — | **Add as new card** |

### Re-Export Compatibility

Cards exported from v1.1.2 will contain composite IDs. When re-imported, the
parser detects the `__` separator and preserves the existing composite ID
rather than double-prefixing, ensuring clean round-trip export/import cycles.
